## PHOTO UPLOAD APPLICATION

## FEATURES

Client Branded photo taking interface.

Users can either upload a photo or take one using their device. The system will run an automated check for proper exposure, background clarity, and neutral expression (aka passport photo checker).

Users can login to the system using their account inside and out of the site or college or University.

Photos uploaded must adhere to the guidelines provided by the site, and these will be checked by the software.

Photos will be checked for filters, sunglasses, position of face, multiple faces, etc. Photos which do not meet standard will be immediately rejected.

These filters are flexible, and sensitivity is customisable.

Photos that pass the initial checks will then need to be cropped by the student, which will then be checked again that it meets standards.

“Auto Admin” can be setup to automatically save approved photos into iCard and MIS.

Else, admins have the ability to review submitted photos that have passed initial checks. They can approve or reject them with a reason.
